SYNERGI™ LIFE

Improvement Management module

Successful organizations are constantly evolving and staying ahead of changing core conditions, customer demands and stakeholder requirements. If you can convert this need into innovation and change you have the potential to grow your competitive edge. The Improvement Management module in Synergi Life supports your company's continuous improvement process.

Strategy implementation

Synergi Life's Improvement Management module is built to support strategy implementation through systematic improvement studies and target improvement plans, enabling you to ensure that the best improvement proposals are acted upon. The entire organization will be able to follow action plans and implementation strategies, including expected gains and due dates.

Organizations with continuous improvement as a core principle will find that Synergi Life helps to secure this process by identifying responsible people, monitoring progress and sending alerts if due dates are passed.

The Improvement Management module consists of case types for proposed improvements, improvement studies and target improvement plans. All come with the standard Synergi Life functions of collecting, processing, analysing and communicating performance data. This module has been designed to allow any individuals or organizational units to come up with improvement proposals for a process, product, work practice or strategy.

The improvement analysis process and target improvement plans allow your company to evaluate established targets and objectives while creating specific action plans for improvement and conducting cost benefit analyses. Achievements and gains from the improvement process and investment are easily monitored through the built-in report and analysis tool.

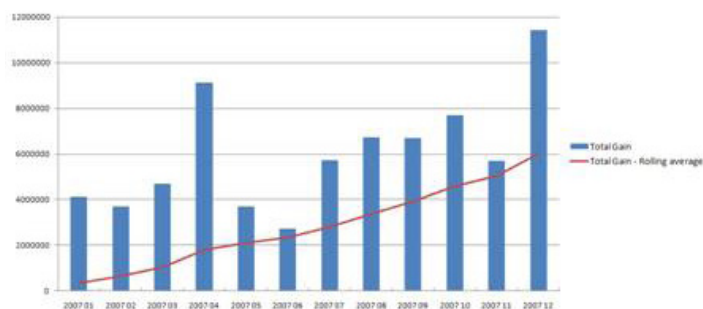

The Synergi Life search and reporting tool supports random searches, in addition to saving and distributing favourites. Users can exclude or include information and adjust the design of the reports according to current needs. Results are displayed in a number of flexible lists, views and reports or exported to Excel, Word or PowerPoint. In simple terms, this helps users to monitor their continuous improvement processes and to measure and communicate their effects internally, to clients and to external stakeholders.

Improvement management process

The improvement management process often forms a good match with the standard Synergi Life workflow, which covers everything from planning and execution to follow-up and analysis. The system also allows for tailoring to implement customer-specific preferences. This module will help you secure effective communication and transparency in your improvement process. And it will provide an effective tool for streamlining the process of identifying, verifying and implementing action plans and improvement initiatives.

IMPROVEMENT PROCESS SOFTWARE
